# **Managing and Accessing a TV Media Archive with Topic Maps**

**The RTV Dubai Project**

# Roadmap

■ **The Challenge**

■ **The Idea**

■ **The Solution**

■ **The Demos**

■ **The Conclusions**

# The Challenge

If RTV Dubai knows what RTV Dubai knows

# RTV Dubai Facts at Project Start

- 4 TV stations and 3 radio stations
  - News, sports, entertainment, culture
- Analogue archive of media objects
  - 17,000 hours audio material
  - 21,000 hours video material
  - Material in Arabic and English
  - Plan to grow
- More than a dozen different databases
- Manual management of archive
  - Costly archiving process
  - Slow manual access
- Unsatisfied journalists
- Value of archive not used
- Lots of money spend for archive without getting ROI

# What to do?

- Introduce digital media archive
  - 1 terabyte online, 50 terabyte nearline
  - later on: 200 terabyte nearline
- Introduce “Portal” as single point of access
  - librarians, journalists, editors, producers
- Improve archiving process
  - automatic meta data extraction
  - automatic categorization
  - automatic cataloguing
- Simplify access to material
  - online access
  - intelligent search and explorative navigation

# What else to do?

- Improve operational efficiency
  - (dead) archive will become (lively) library
  - satisfied journalists will use library
  - reuse of content reduces production costs
- Get ROI
  - Spend money in new technology instead of wasting it for in-efficient archive
  - little risk when project fails, but big ROI when it succeeds

# Project Partners

## Customer:

- Dubai Department of Information in United Arab Emirates

## Prime contractor:

- BAMES – Bertelsmann Arvato Middle East Sales – an empolis company

## Sub contractor:

- blue order – a tecmath company
  - media archive<sup>®</sup>
- empolis GmbH
  - empolis knowledge manager – formerly known as orange and k42<sup>®</sup>

## Total project order value:

- US\$ 6.4 million over 4 years
- mainly hardware costs

# Project Challenges

- Legacy data migration
  - analogue tapes
  - other digital legacy systems
- Bi-lingual (Arabic & English)
  - material
  - search
  - ontologies (topic maps)
- Integrate blue order's Media Asset Management system with empolis' Information Access Management system
  - close integration necessary
  - interface level and data level
  - empolis built business connector
  - strategic partnership

# The Idea

Applying knowledge management technologies

# Knowledge Management

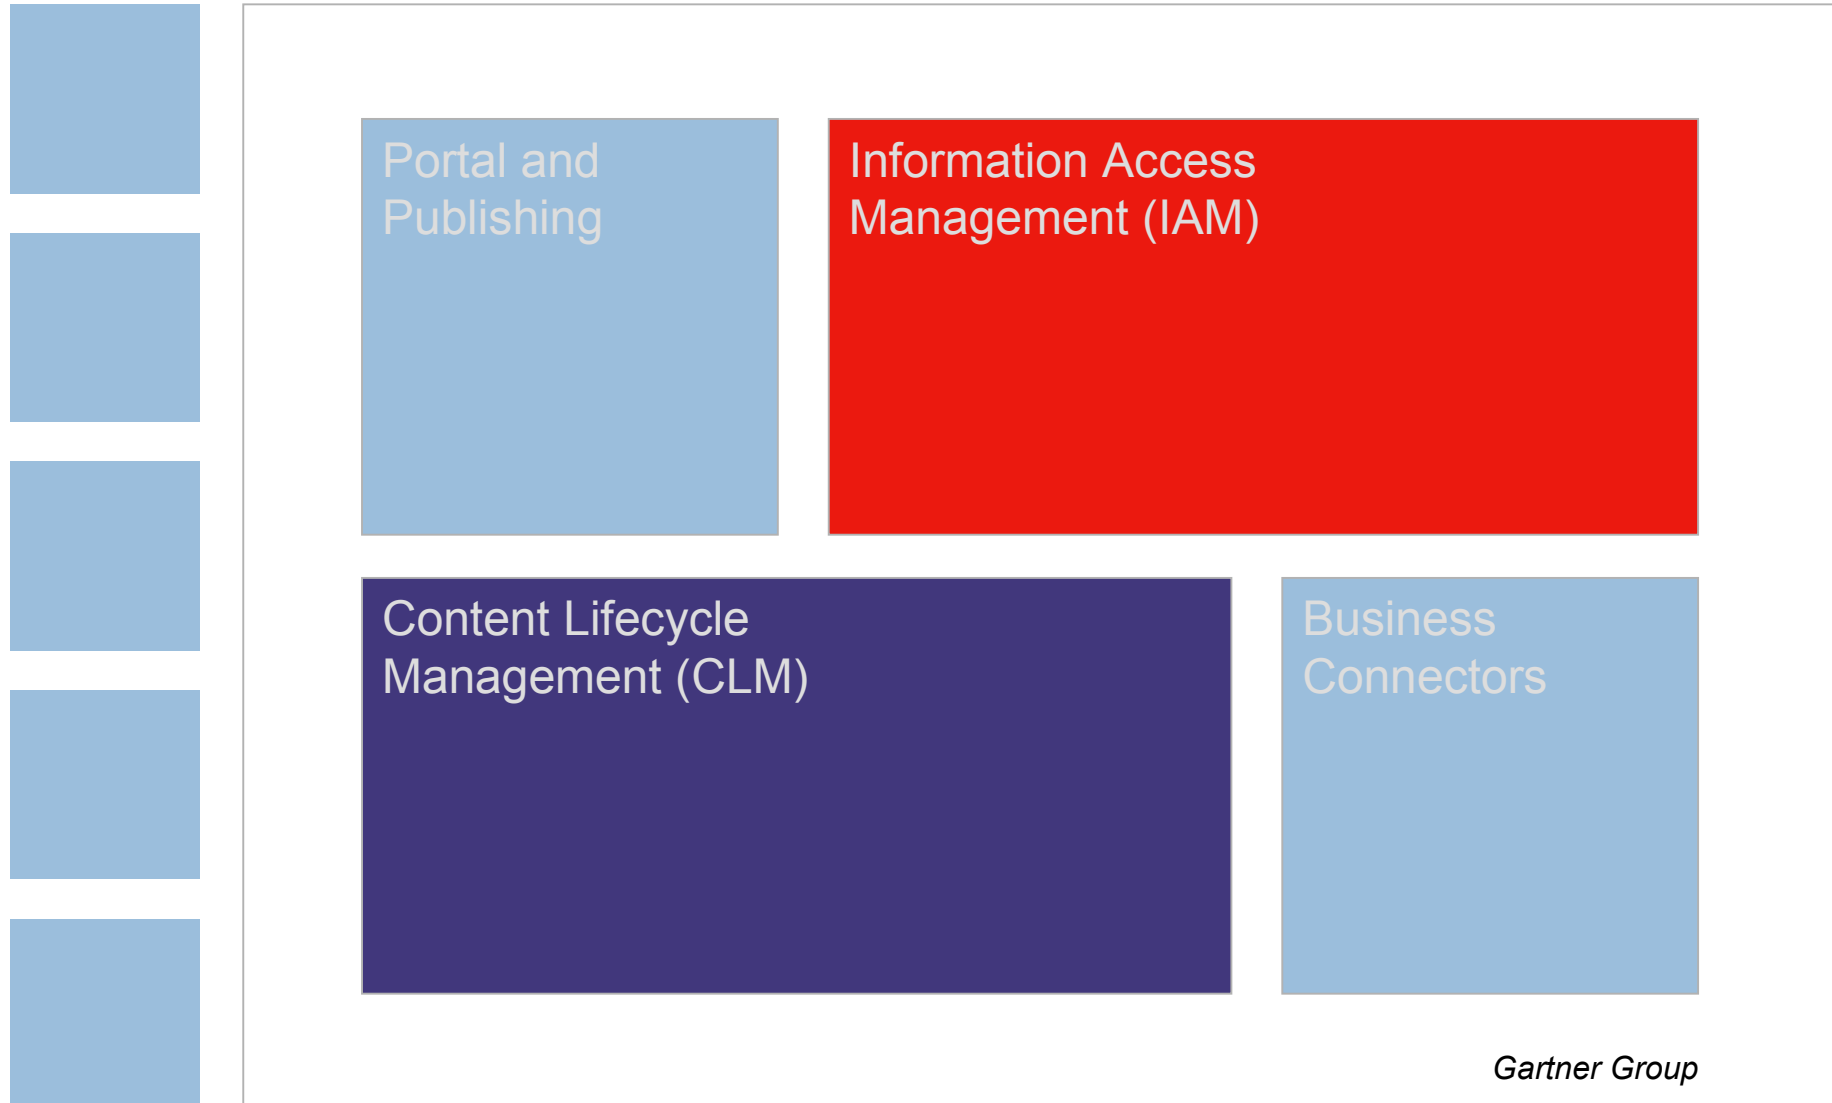

Knowledge management transforms **structured** and **unstructured** information, **selects** and **combines** the important **information** for a user in a specific context, so that **decisions** and the **actions** of companies are supported.

To be able to realize knowledge management in a company, a multitude of individual IT solutions must be taken into consideration and viewed within a **holistic** approach, e.g. **archiving** and **DMS systems**, **retrieval** and **agent technologies**, **workflow**, **portal** and **content management systems**.

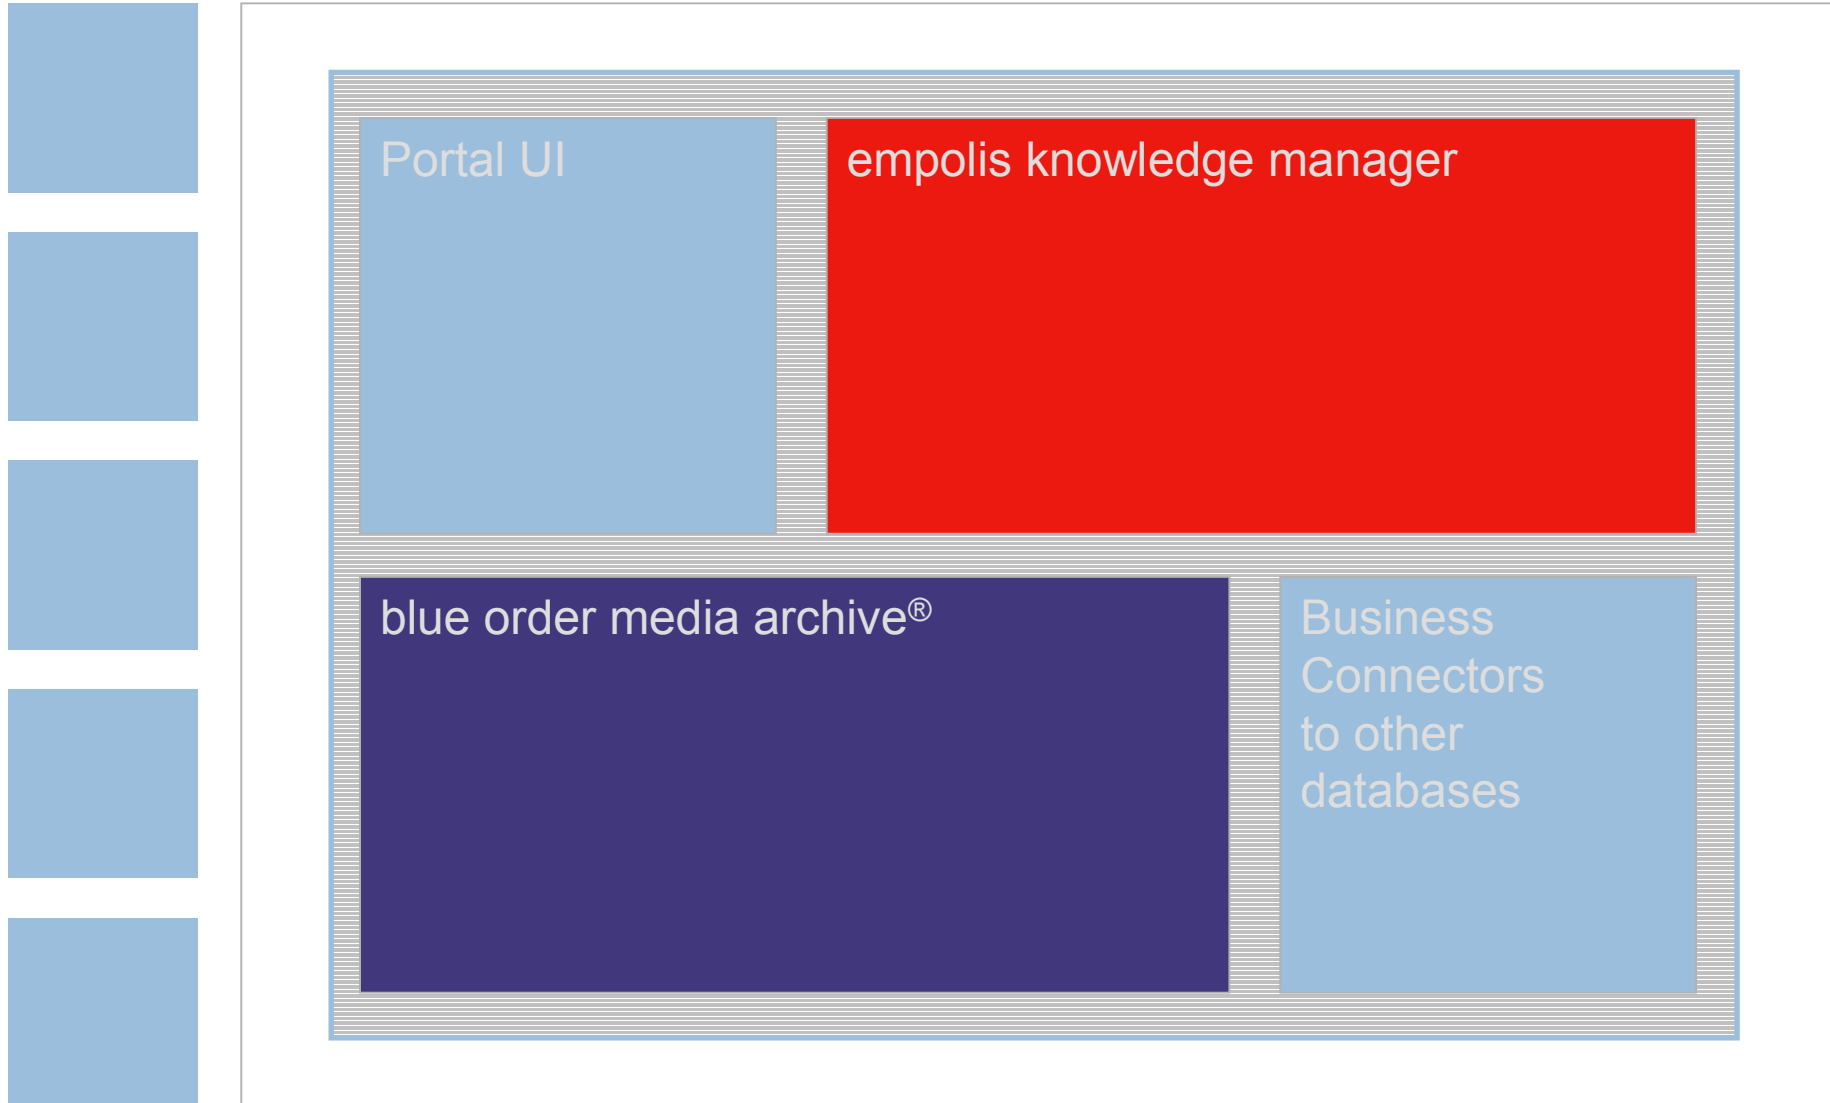

*Meta Group 2001*

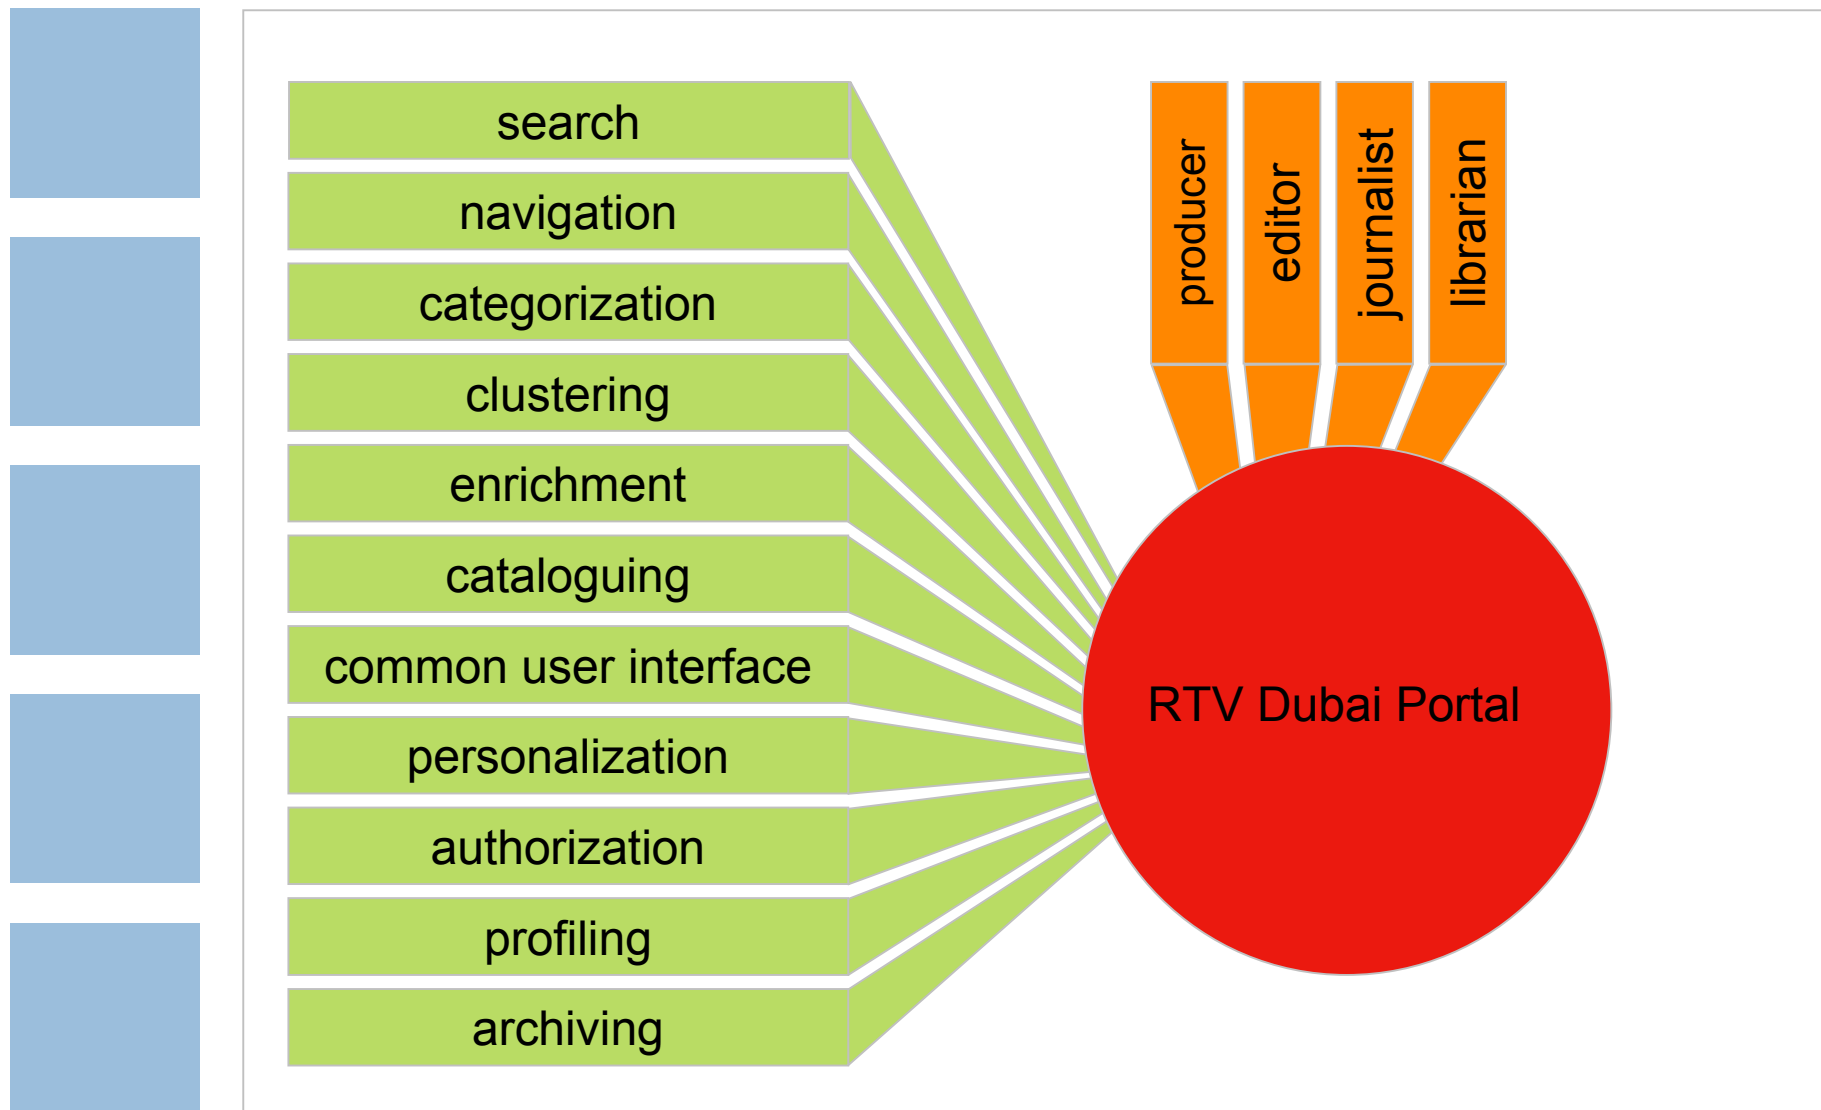

# Enterprise Knowledge Management = *CLM* + *IAM*

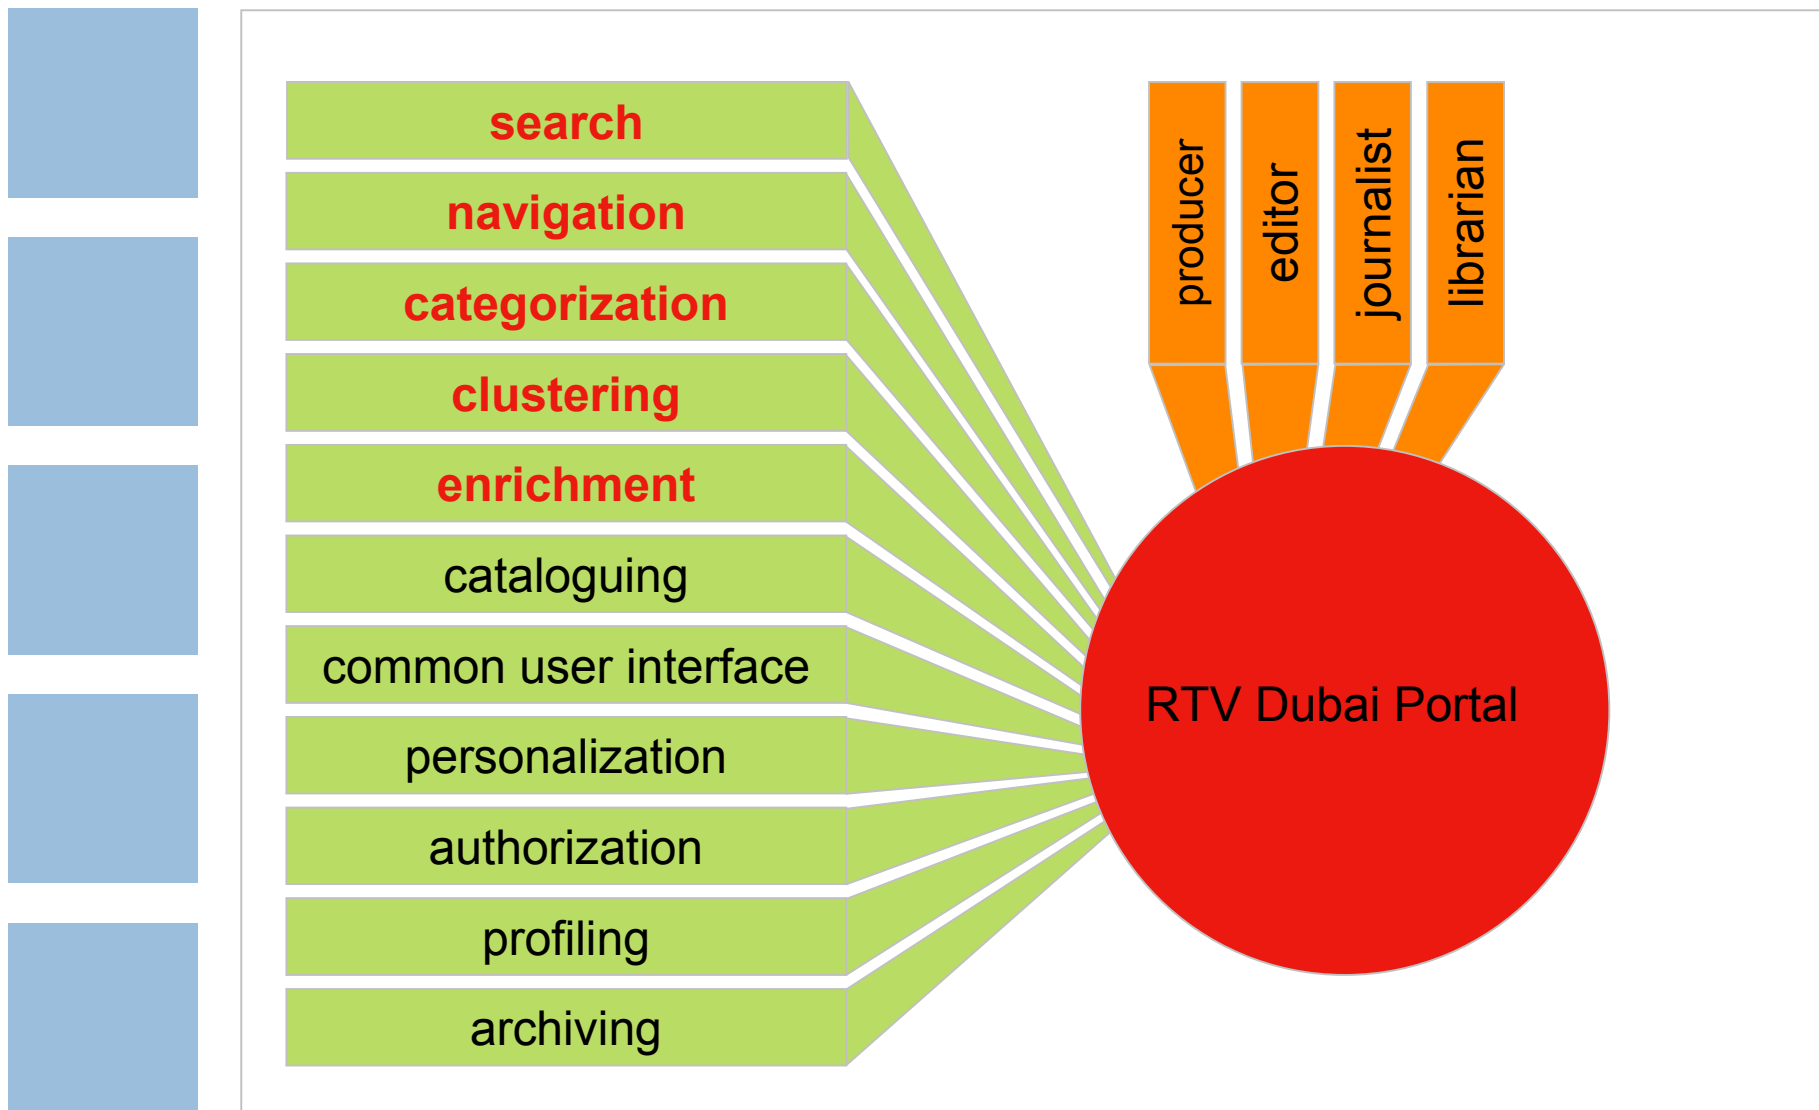

# RTV Dubai Media Library Solution

# RTV Dubai Media Portal

# RTV Dubai Media Portal

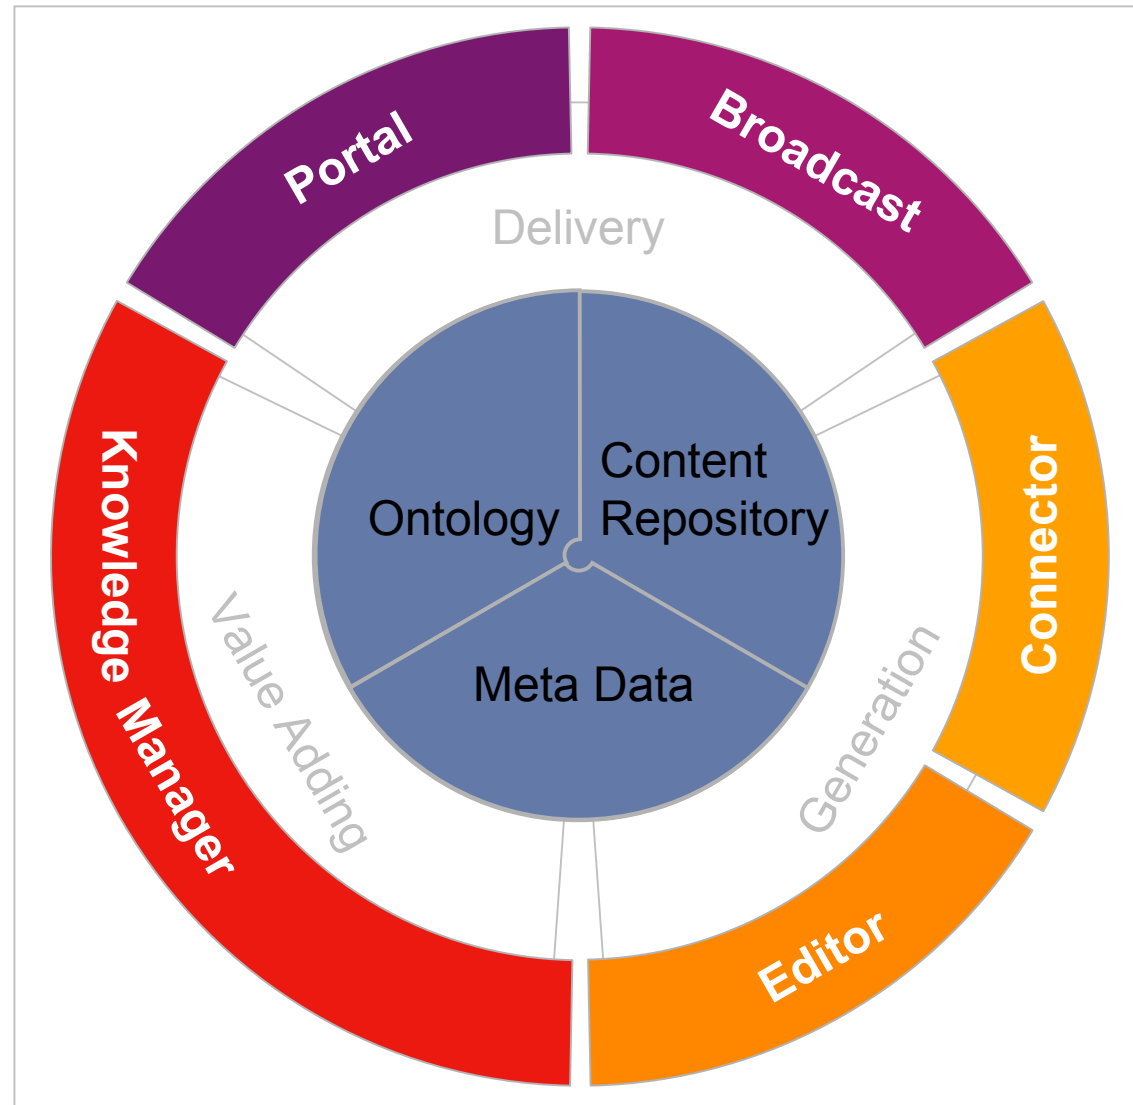

# Transforming Content into Knowledge

An explicit knowledge model (= **Topic Map**) adds significant value to managed content.

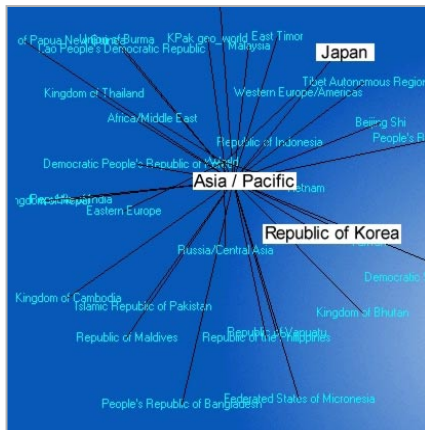

**Topic Map is used for:**

- Semantic Indexing & Intelligent Retrieval
- Navigation
- Categorization
- Classification
- Enrichment

# Pre-Modelled Topic Maps as Starter Kit

## The Solution

Searching, filtering, and organizing  
the RTV media archive

## Traditional Search in Media Archives

Find media objects (at all)

# Traditional Search in Media Archives

## Full-text retrieval:

■ Query:

"Formula 1" AND  
"Michael Schumacher" AND  
"year 2000" AND  
"winner"

## Database search:

■ Query:

Date of event: *May 14, 2001*  
Sport: *Formula 1*  
Athlete: *Michael Schuhmacher*

# Problems with Traditional Search

## Full-text retrieval:

- **Too many hits!**
- Query: "winner" and "Michael Schumacher"
- Result:
  - *Formula 1 race in ...*
  - *...*
  - *Interview with Michael Schumacher ...*
- Reason:
  - Query is too vague

## Database search:

- **No hits!**
- Query: "Race on May 14, 2001 by Michael Schuhmacher"
- Result:
  - *0 hits found.*
- Reasons:
  - Race was on May 13, 2001; not on May 14
  - Mistyping of athlete

# Intelligent Search

Find relevant media objects

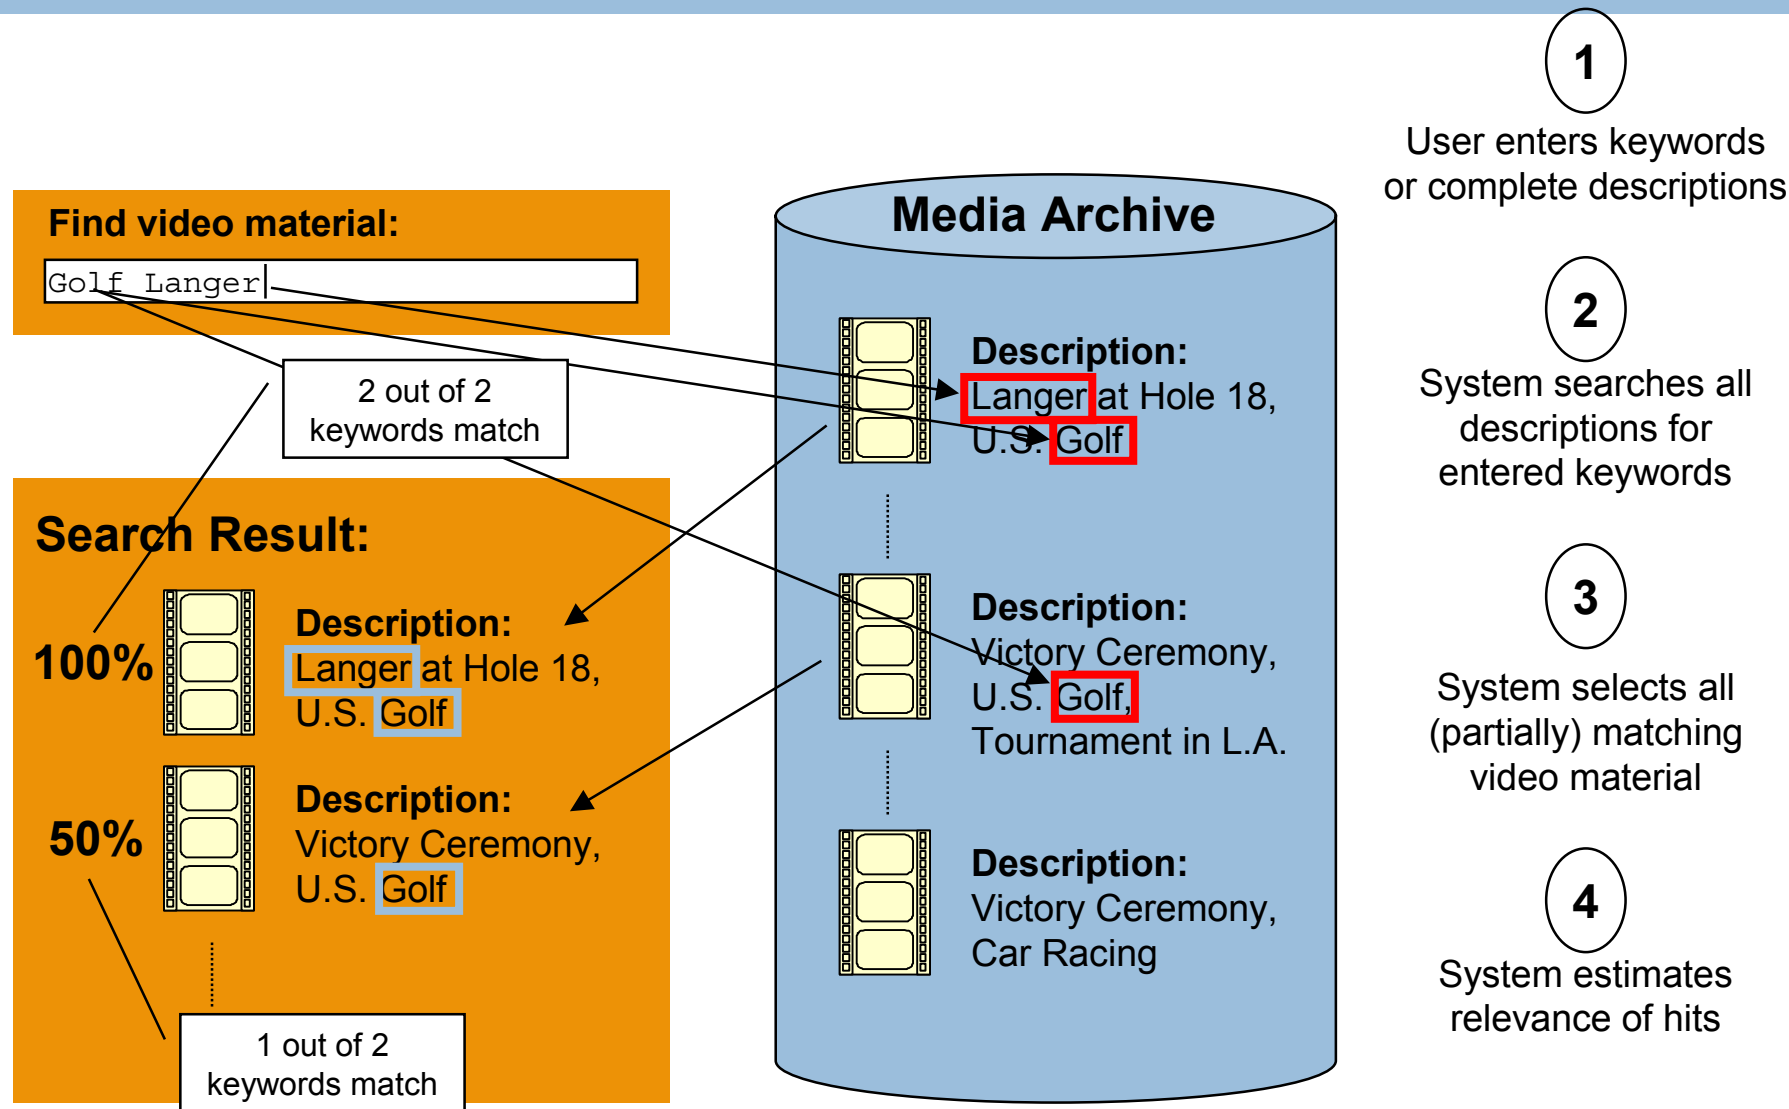

# Goals for Advanced Search for Media Objects

- Find relevant media objects with little effort
  - i.e., with as few search requests and mouse clicks as possible
- Tolerate misspelled input
  - suggested spell correction
  - controlled vocabulary (= topic map)
- Allow cross-lingual search
  - e.g., find English documented media objects with Arabic query and vice versa
- Find related information and media objects
  - content enrichment (= links into topic map)
  - explorative browsing of topic map

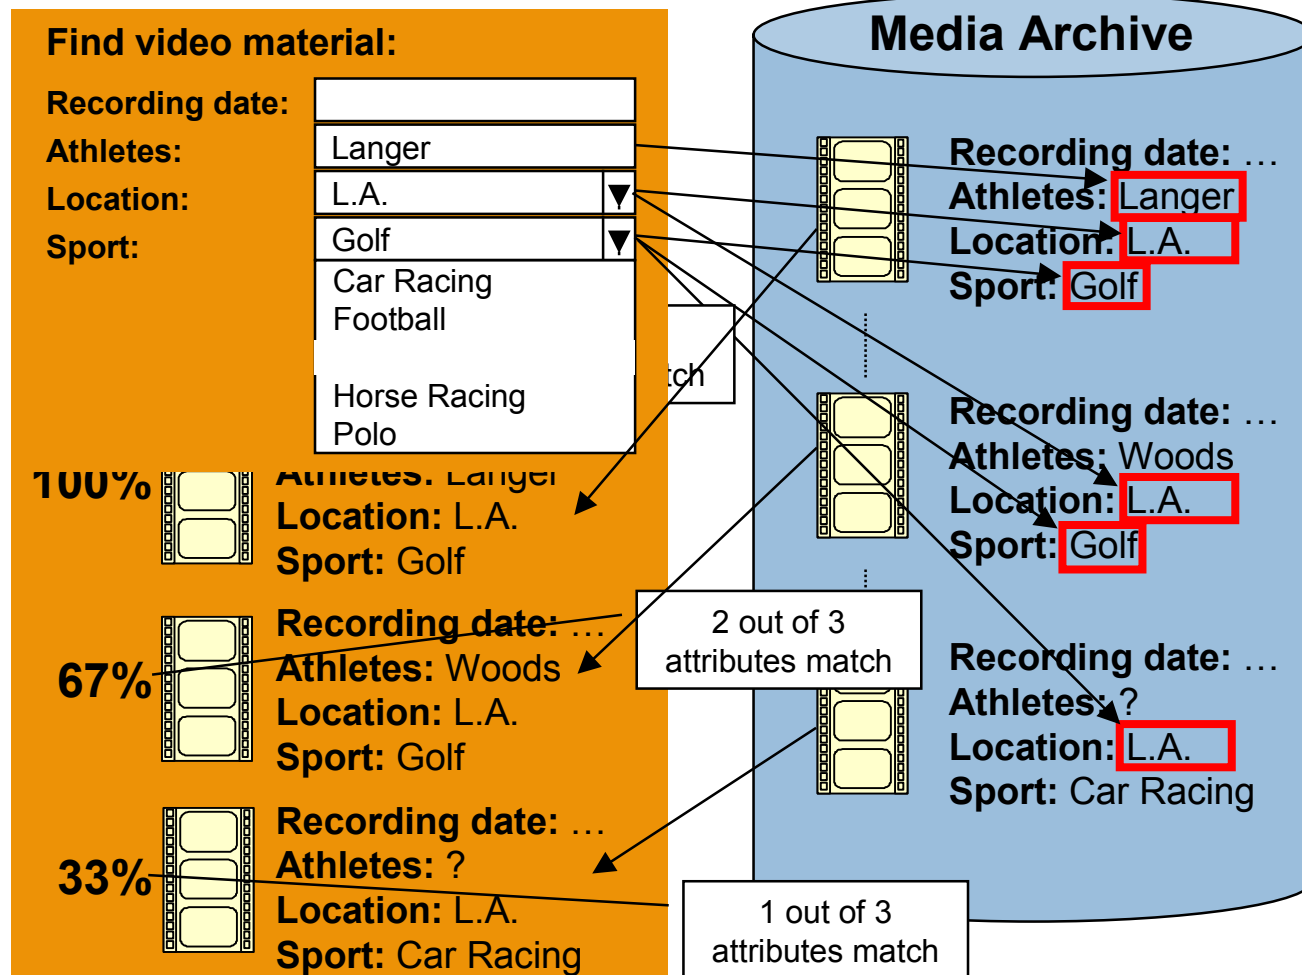

# Full-Text Search

# Search Using Attributes

1

User enters attribute values

2

System searches all characterizations

3

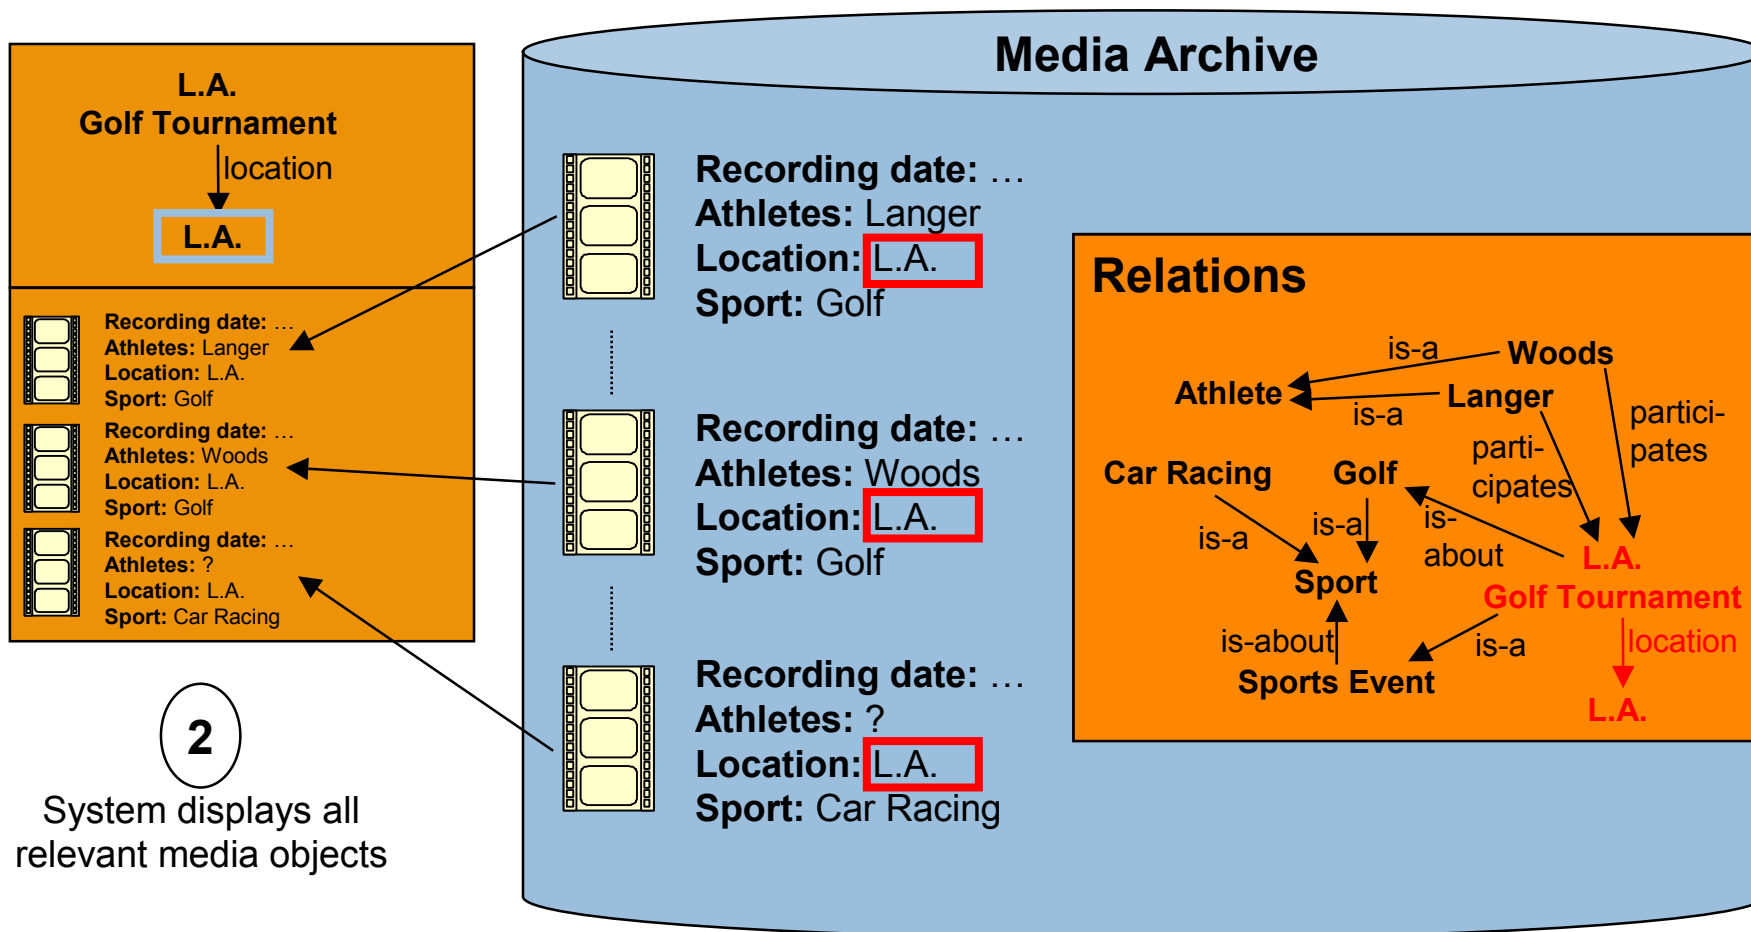

System selects all (partially) matching video material

4

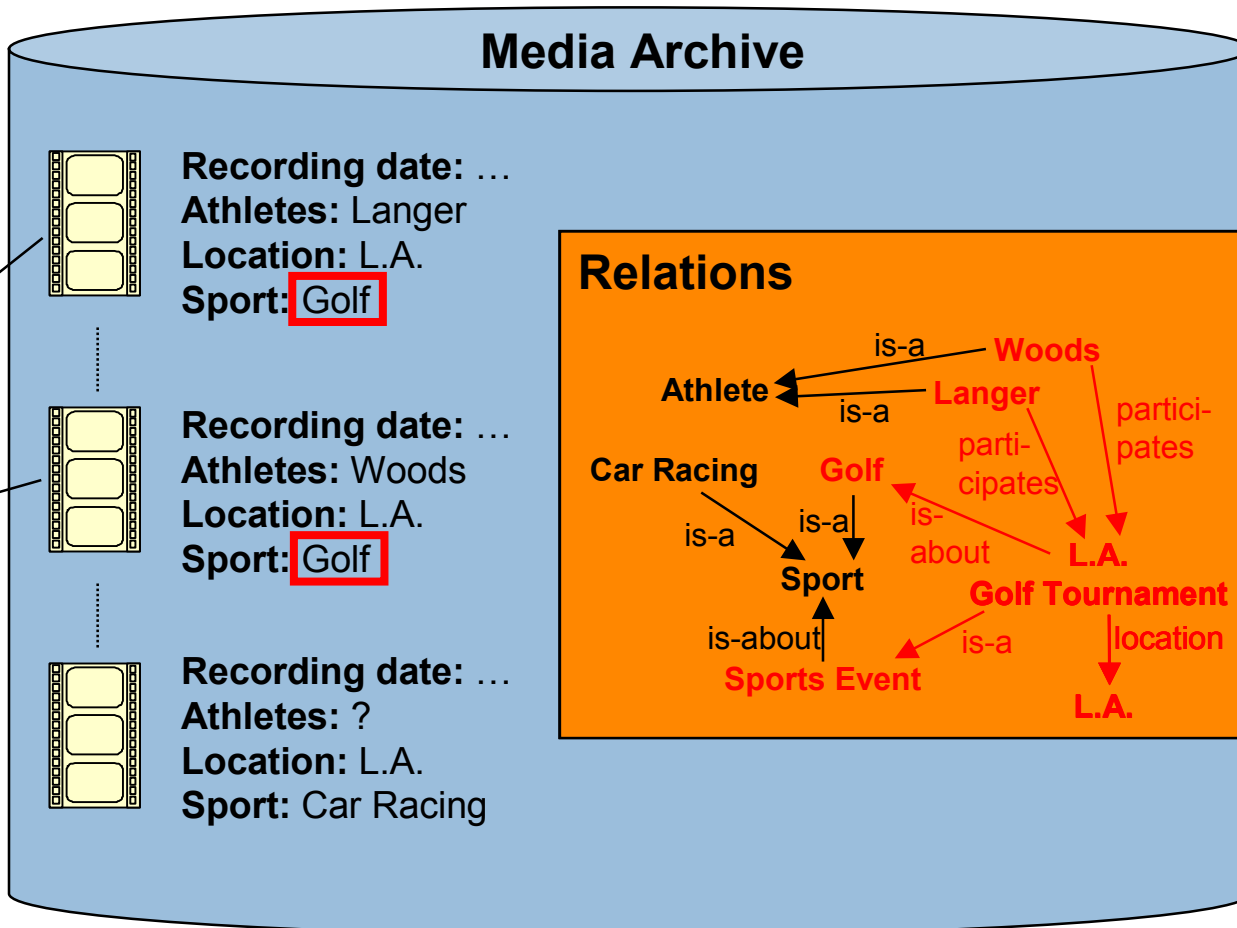

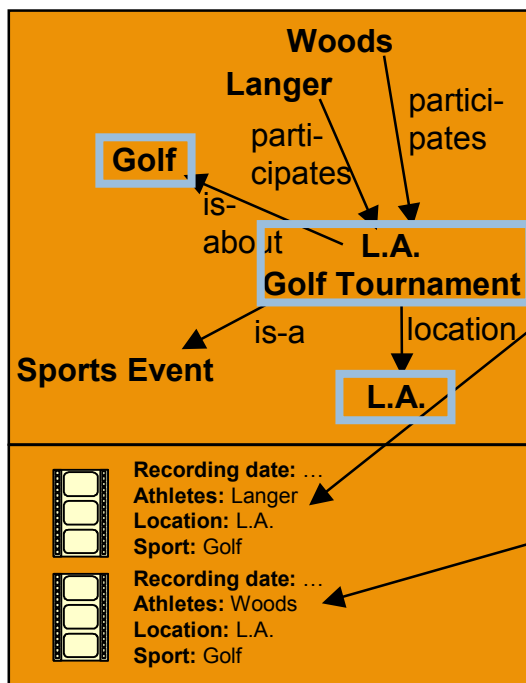

System estimates relevance of hits

# Search Using Visual Navigation

# Search Using Visual Navigation

4

System displays all relevant media objects

# Seamless Integration of Search Methods

**Find video material:**

Recording date:

Athletes:

Location:

Sport:

Other (full-text):

1

User specifies needed material

Recording date: ...  
Athletes: Langer  
Location: L.A.  
Sport: Golf

Recording date: ...  
Athletes: Woods  
Location: L.A.  
Sport: Golf

4

Selection of final list

2

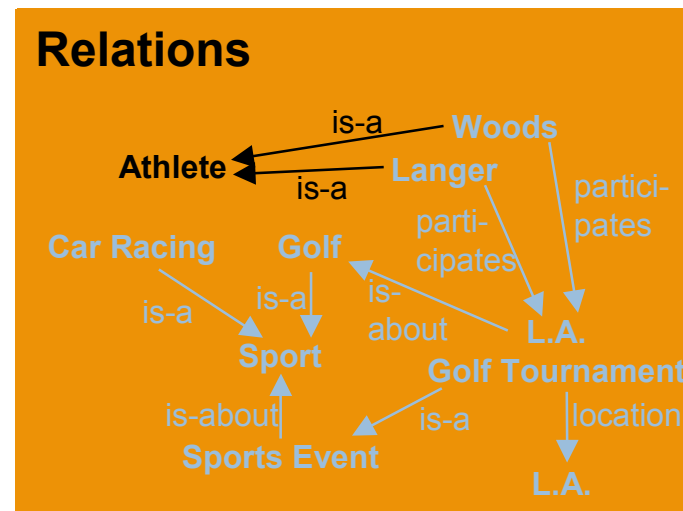

Search considering both attributes and full-text entry

	Recording date: ... Athletes: Langer Location: L.A. Sport: Golf	Description: Langer at Hole 18, U.S. Golf
	Recording date: ... Athletes: Woods Location: L.A. Sport: Golf	Description: Victory Ceremony, U.S. Golf, Tournament in L.A.
	Recording date: ... Athletes: ? Location: L.A. Sport: Car Racing	Description: Victory Ceremony, Car Racing

3

Visual navigation

# Advantages of the Proposed Approach

- Spelling correction
- Similarity-based search
- Relevance estimation of hits
- Explanation why hit appears in list
- Intelligent dialog to refine query
- Cross-lingual search
- Visual Navigation for finding related material
- Open Standards (XML, SMEF, Topic Maps, Dewey)

# Powerful Archiving

Make media objects available

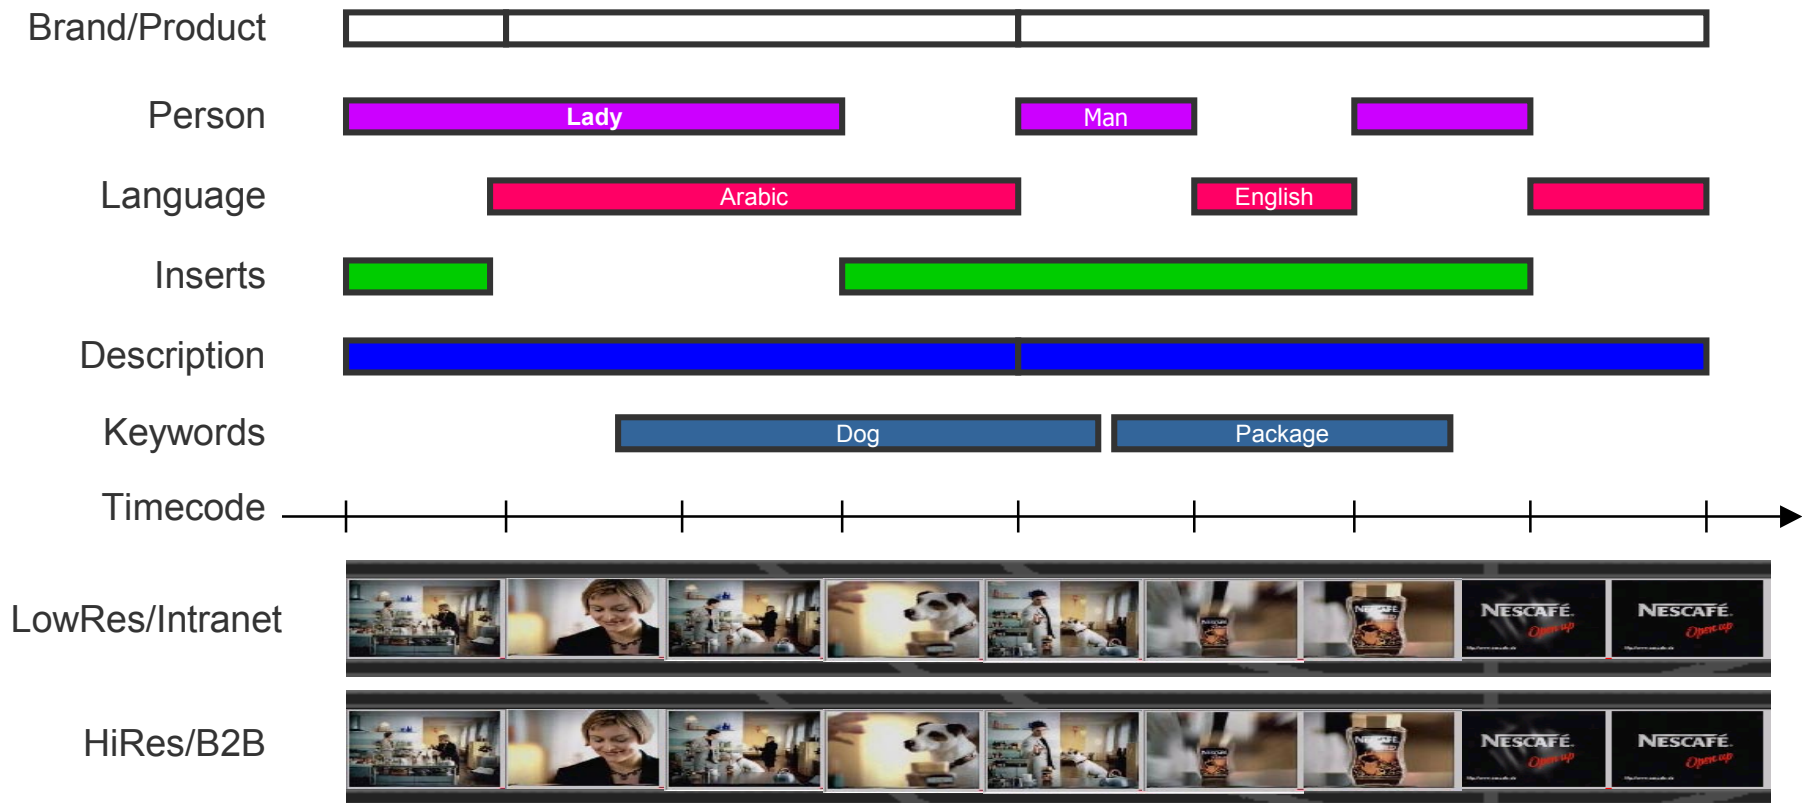

# Goals for Archiving Media Objects

- Faster archiving
- More accurate archiving
- More complete archiving
- High automation
  - i.e., automatic generation of attribute values and relations

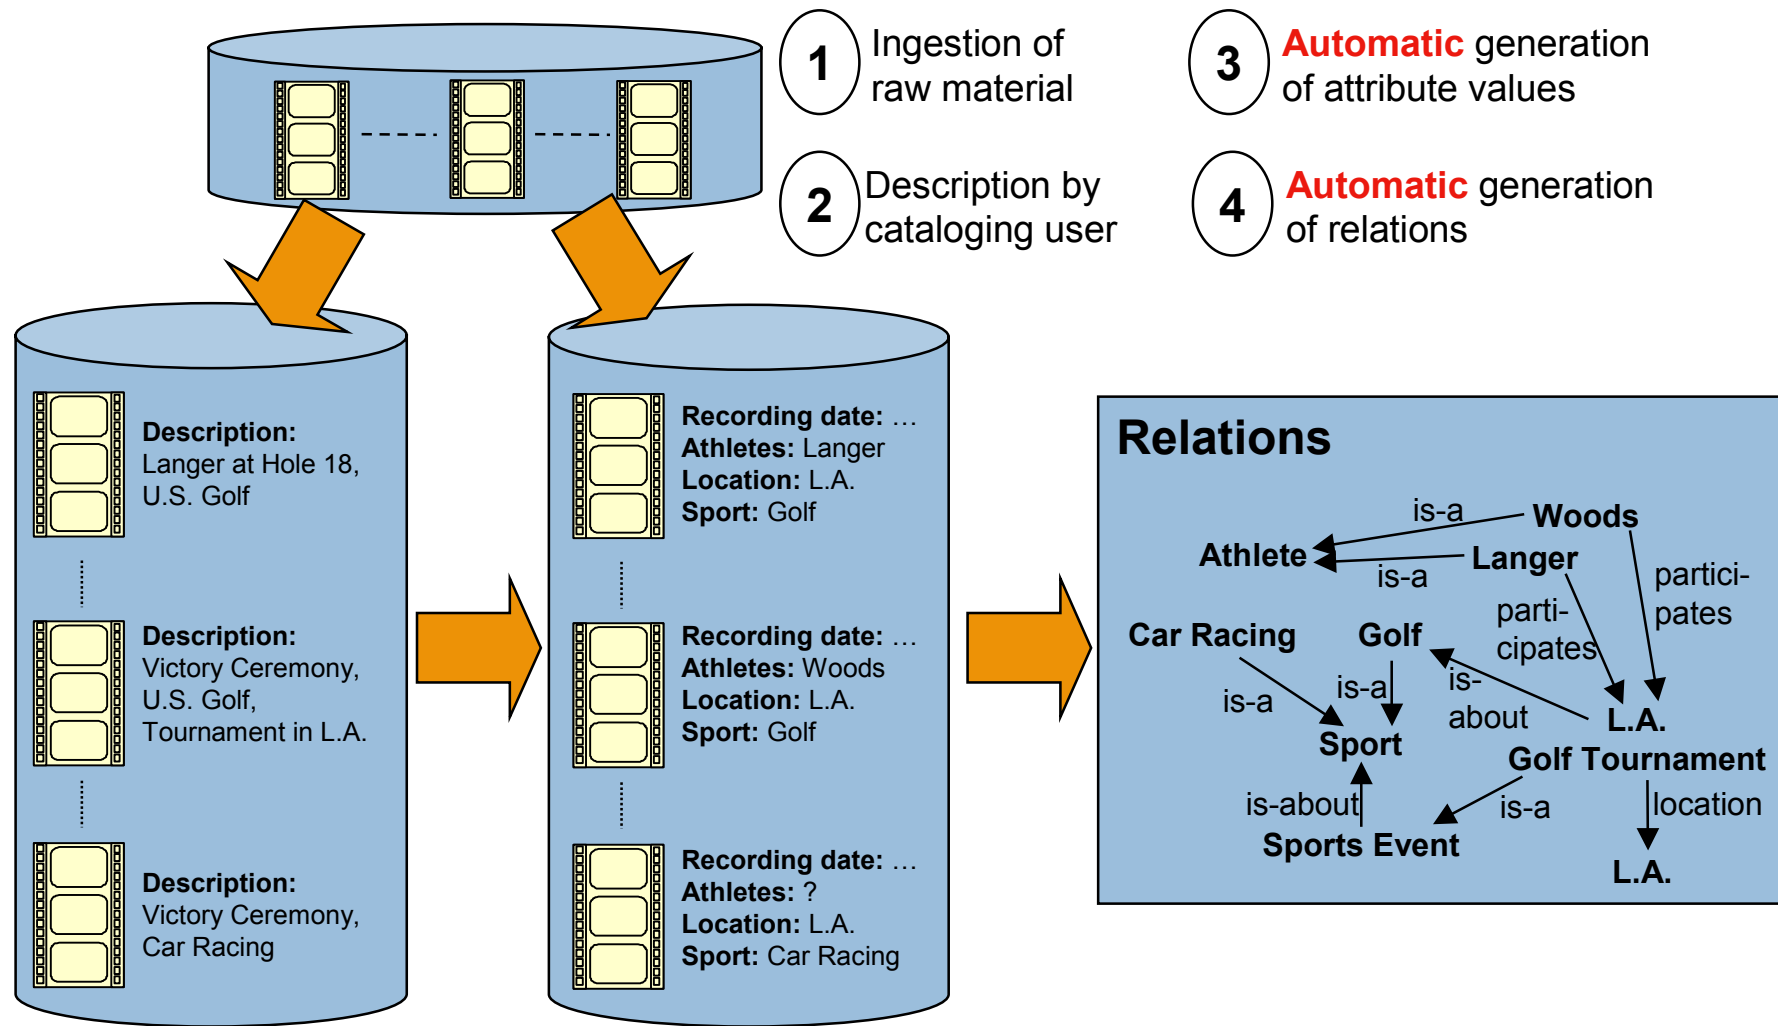

# Stratified Documentation in media archive<sup>®</sup>

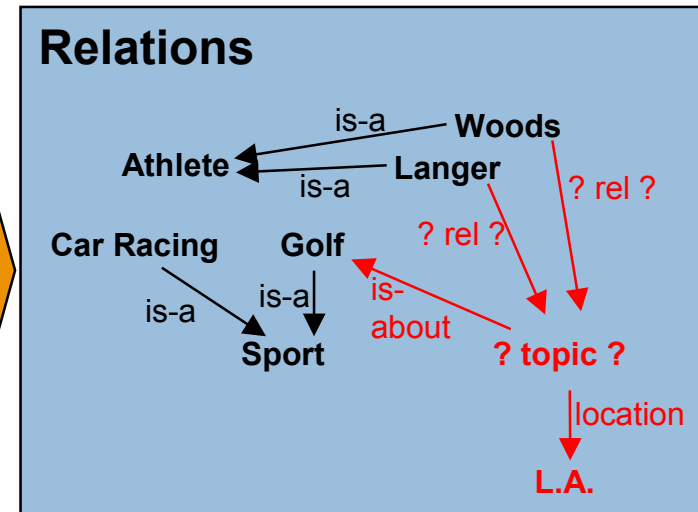

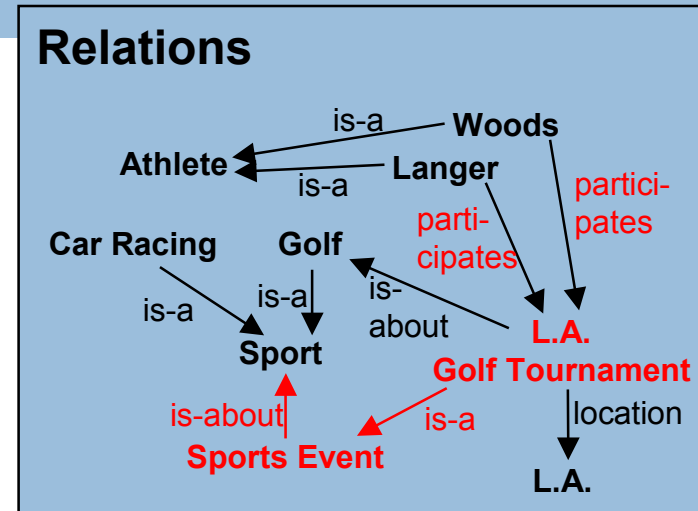

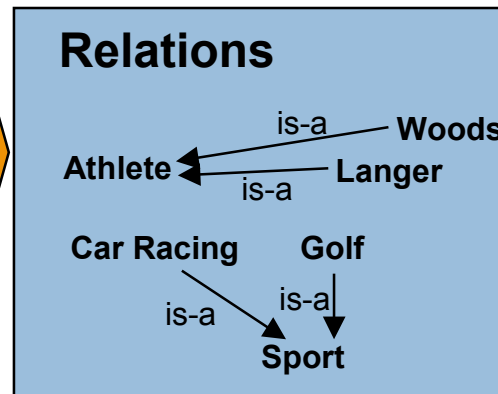

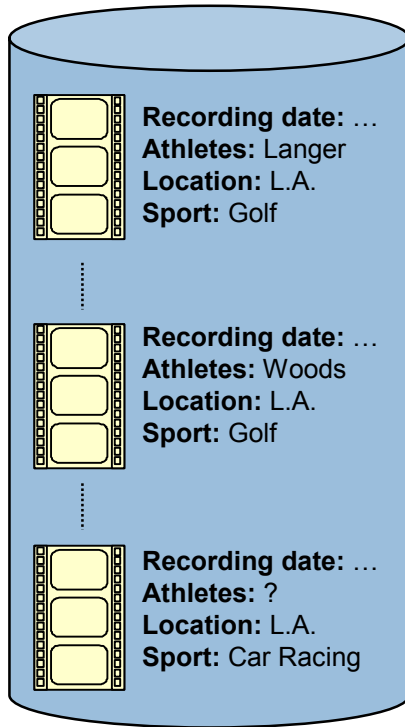

# Archiving: Workflow

# Generation of Relations

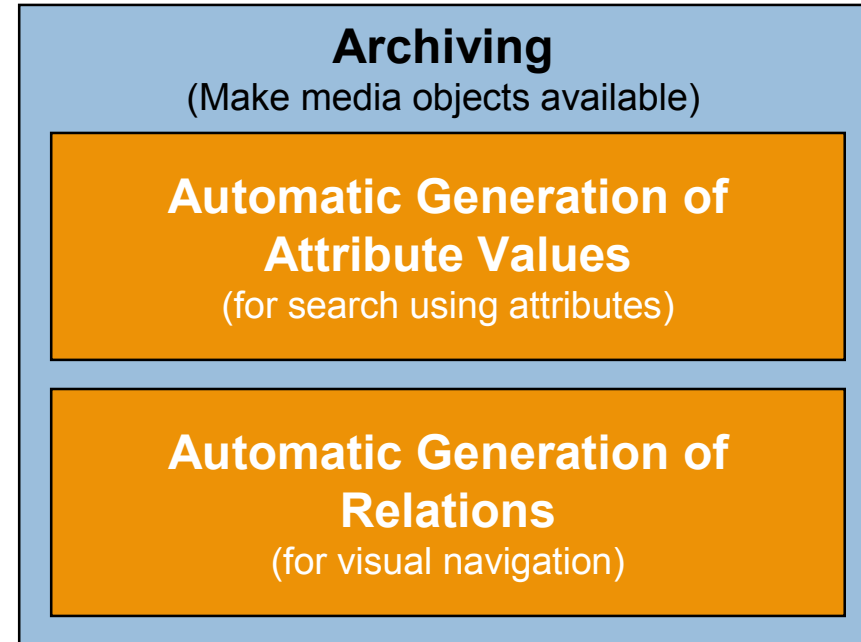

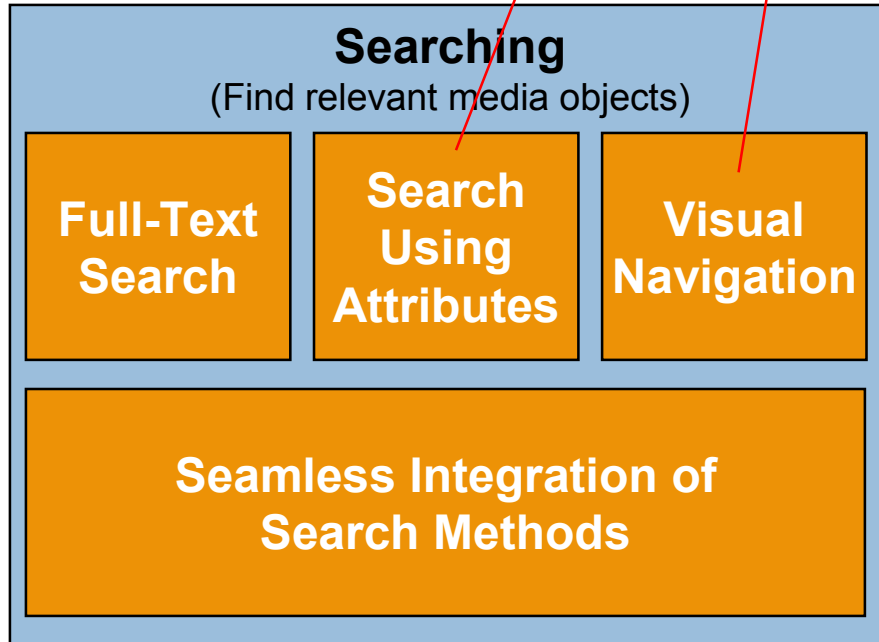

- 1 Based on attribute names and values, an initial topic map for relations is generated
- 2 Further relations are **suggested through statistical analysis**
- 3 Final modifications and extensions are done by cataloging user

# Summary

Attribute search supports among others the **Dewey classification** and **SMEF** (Standard Media Exchange Framework – a BBC standard for exchanging video material)

Supports **Topic Map** standard (ISO 13250)

There are 3 ways to find media objects

The search methods can be used in combination

Before media objects can be used, they must be stored (archived)

The information needed for the sophisticated search methods can be generated automatically

# The Demos

“Movie Library Sales“ and “Knowledge in Media”

# Demo – Movie Library Sales

- Finding animal movies
  - intelligent search driven by topic map
  - KPak geo
  - German movie library

# Demo – Movie Library Sales

Library-Sales - Microsoft Internet Explorer

Internet

Query: "eating arabic bird in a dessert in a total camera shot"

# Demo – Movie Library Sales

**Analyzed query**

**Anfrage:**  
 fressender (fressen: Tierverhalten.V1), arabischer (Arabien: Geo.V1) vogel (Vögel: Tierart.V1) in der wüste (Wüste: Landschaft.V1) in einer totalen (Totale: Einstellung.V1)

**Topic types (classification schema)**

**Filmausschnitte 1 bis 20, die der Anfrage entsprechen**

Ähnlichkeit	Art	Verhalten	Geo	Landschaft	Einstellung	Weitere Schl...
76 %	Fischadler (64%)	Jungenaufzucht, fressen (100%)	Arabien, Asien (100%)	Wüste (100%)	Void	arabia, asia, coast, desert, nest, saudi
76 %	Fischadler (64%)	Jungenaufzucht, fressen (100%)	Arabien, Asien (100%)	Wüste (100%)	Void	arabia, asia, desert, saudi
62 %	Reiherläufer (80%)	Ruhe, ruhen	Arabien, Asien (100%)	Wüste (100%)	Void	arabia, asia, coast, desert, saudi
56 %	Strauße (64%)	Nahrung	Afrika, Namibia	Wüste (100%)	Stand, Totale (100%)	africa, desert, ingestion, long, shot
56 %	Strauße (64%)	Bewegung, Nahrung, kriechen	Afrika, Namibia	Wüste (100%)	Schwenk, Totale (100%)	africa, desert, ingestion, long, panning, shot
56 %	Strauße (64%)	Nahrung	Afrika, Namibia	Wüste (100%)	Stand, Totale (100%)	africa, desert, ingestion, long, nest, shot

**How results match classification**

**Similarity between result and query**

# Demo – Knowledge in Media

- Finding news in text archive
  - search & navigation
  - KPak media
  - Reuters news

## The Conclusions

Topic maps play important role,  
but are only one technology among others

# Conclusions

- RTV Dubai extremely benefits from the combination of
  - digital media archive
  - improved and simplified access
  - automated archiving process
  - increased user satisfaction
  - higher content reuse ratio
- Topic maps are the central ontologies driving
  - categorization & classification
  - search
  - navigation
  - enrichment
- But topic maps have to be accompanied by other technologies
  - Media meta data (= stratified documentation of material)
  - Case Based Reasoning (= intelligence)
  - Portal (= personalization, authorization, integration)

**</End>**
